                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            -!- COFACTOR: Binds 4 calcium ions per subunit (By similarity).
-!- COFACTOR: Binds 2 zinc ions per subunit (By similarity).
-!- SUBUNIT: Ligand for integrin alpha-V/beta-3.
-!- TISSUE SPECIFICITY: Produced by normal skin fibroblasts.
-!- PTM: The propebtide is processed by MMP14 (MT-MMP1) and MMP16 (MT-MMP3) (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    (gelatinase) that is elevated in Rous sarcoma virus transformed chicken embryo fibroblasts.";
J. Biol. Chem. 266:5113-5121(1991).
--- CATALYIIC ACTIVITY: Cleavage of gelatin type I and collagen types IV, V, VII, X. Cleaves the collagen-like sequence Pro-Gln-Gly-Ile-Ala-Gly-Gln.
                                                                                                                                                                                Gallus gailus (Chicken).

72 kDa type IV collagenase precursor (EC 3.4.24.24) (72 kDa gelatinase) (Matrix metalloproteinase-2) (MMP-2) (Gelatinase A)
Name=MMP2;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                MMP3) (By similarity).
--- SIMILARITY: Belongs to the peptidase M10A family.
--- SIMILARITY: Contains 3 fibromectin type-II domains.
--- SIMILARITY: Contains 1 hemopexin-like domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Ensembl; ENSGALGO0000003580; Gallus gallus.

(KIMB ) KIMBERLY-CLARK WORLDWIDE INC.

```
The present invention describes an anti-angiogenic composition (I) for inhibiting expression of vascular endothelial growth factor (WGGF). (I) comprises an effective amount of a peptide inhibitor of matrix comprises an effective amount of a peptide inhibitor of matrix antidiabetic, ophthalmological and dermaclogical activities. (I) can be artidiabetic, ophthalmological and dermaclogical activities. (I) can be used for inhibiting expression of VGGF, and so can be used for inhibiting expression of VGGF, and so can be used for inhibiting convert of tumours and diminishing tumours size. The tumour can be createfact, non-metastatic, vascularised, non-vascularised, hard or soft. (I) is also useful for treating injuries including wounds, surgical incisions, chronic wounds, heart diseases and stroke. (I) is also useful for treating disorders characterised by excessive angiogenesis e.g. macular degeneration and diabetic retinopathy. The present sequence represents a human MMP cleavage region peptide, which is used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

The invention is useful for increasing the amount of fibronectin in tissue. The invention is also useful for encouraging the maintenance and development of healthy skin, preventing and treating wrinkles and for treating wounds. The invention acts as unlergary and dermatological agents. The present sequence is human matrix metalloproteinase (MMP) cleavage region peptide. This sequence is used in the exemplification of the invention.
                                                The present invention relates to peptide inhibitors of metalloproteinases
                                                           (MMPB), particularly metalloproteinase-2 (MMP-2). The inhibitors have peptide sequences related to the cleavage regions of the promoryme forms of the MMPS. The peptide inhibitors are useful for stimulating cellular proliferation of fibroblasts or keratinocytes, promoting healthy skin development, treating wounds, preventing scarring, improving skin tone, reducing wrinkling and for simulating the development of smooth, healthy skin. The peptide inhibitors are useful as anti-aging and wound healing compounds. ABG76309-ABG76321 represent peptide inhibitors of MMPs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention provides peptides and compositions containing such

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This invention relates to a novel composition for inhibiting growth of chondrosarcoma cells comprising an amount of a peptide and a chondrosarcoma cells comprising an amount of a peptide and a chondrosarcoma cells comprising an amount of a peptide and a chondrosarcomical carrier. The invention may be useful for the production of compounds with a cytostatic activity acting as metalloprotease 1 inhibitors, metalloprotease 5 inhibitors, metalloprotease 5 inhibitors, metalloprotease 6 inhibitors, metalloprotease 7 inhibitors, metalloprotease 9 inhibitors, metalloprotease 10 inhibitors, metalloprotease 11 inhibitors, metalloprotease 11 inhibitors, compassing metalloprotease 12 inhibitors, metalloprotease 13 inhibitors, composition is useful for decreasing and inhibiting the growth of chondrosarcoma cells which in turn inhibits conditionated by the inhibition of the invention in the development of a composition of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention describes an anti-angiogenic composition (I) for inhibiting expression of vascular endothelial growth factor (VEGF). (I) comprises an effective amount of a peptide inhibitor of matrix metalloproteinase (MMP), where the peptide inhibit the expression of WEGF. (I) has cytostatic, vulnerary, cardiant, cerebroprotective, antidiabetic, ophthalmological and dermatological activities. (I) can be used for inhibiting expression of VEGF, and so can be used for inhibiting expression of VEGF, and so can be used for inhibiting growth of tumours and diminishing tumours size. The tumour can be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             metastatic, non-metastatic, vascularised, non-vascularised, hard or soft.

(I) is also useful for treating injuries including wounds, surgical incisions, chronic wounds, heart diseases and stroke. (I) is also useful for treating disorders characterised by excessive angiogenesis e.g.
                                                                                                                                                                                                                                                                                                         Human matrix metalloproteinase 2 cleavage region peptide SEQ ID NO:11.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        macular degeneration and diabetic retinopathy. The present sequence represents a human MMP cleavage region peptide, which is used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Anti-angiogenic composition comprising peptide inhibitor of matrix metalloproteinase, useful for decreasing the expression of vascular endothelial growth factor and treating cancers and tissue injuries.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    100.0%; Score 60; DB 6; Length 19; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to peptide inhibitors of metalloproteinases (MMPs), particularly metalloproteinase-2 (MMP-2). The inhibitors have peptide sequences related to the cleavage regions of the proenzyme forms of the MMPS. The peptide inhibitors are useful for stimulating cellular proliferation of fibroblasts or keratinocytes, promoting healthy skin development, treating wounds, preventing scarring, improving skin tone, reducing wrinkling and for simulating the development of smooth, healthy skin. The peptide inhibitors are useful as anti-aging and wound healing compounds. ABG76309-ABG76321 represent peptide inhibitors of MMPs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Fibronectin; healthy skin; wrinkle; wound; vulnerary; dermatological; human; matrix metalloproteinase; MMP.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                peptides that are useful as agents to maintain healthy skin and to promote the condition of the skin. The invention is useful for increasing the amount of fibronectin in tissue. The invention is also useful for increasing encouraging the maintenance and development of healthy skin, preventing and treating wrinkles and for treating wounds. The invention acts as vulnerary and dermatological agents. The present sequence is human matrix metalloproteinase (MMP) cleaves region peptide. This sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Composition used for preventing and treating wrinkles and treating wounds comprises peptide having sequence related to matrix metalloproteinase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention provides peptides and compositions containing such
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       cell growth; pharmaceutical; cytostatic; metalloprotease 1 inhibitor; metalloprotease 2 inhibitor; metalloprotease 3 inhibitor; metalloprotease 4 inhibitor; metalloprotease 5 inhibitor; metalloprotease 6 inhibitor; metalloprotease 7 inhibitor; metalloprotease 8 inhibitor; metalloprotease 9 inhibitor; metalloprotease 10 inhibitor; metalloprotease 11 inhibitor; metalloprotease 12 inhibitor; metalloprotease 13 inhibitor; metalloprotease 13 inhibitor;

metallo:proteinase peptide(s) - used to inhibit enzyme in treating damage caused by activated enzyme.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Matrix metalloprotease, inhibitor, tissue damage; angiogenesis, antibody; arthritis; tumour growth; granulomatous inflammatory condition; enzyme; metastasis; sarcoidosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Matrix metallo:proteinase peptide(s) - used to inhibit enzyme in treating tissue damage caused by activated enzyme.
                                                                                                                                                                                       IV matrix metalloprotease (MMP) protein. The invention relates to MMP inhibitor peptides which can be used to treat tissue damage caused by activated MMPs. e.g. for treating inappropriate angiogenesis, arthritis, tumour growth, invasion and metastasis and granulomatous inflammatory conditions such as sarcoidosis. Also antibodies to the peptides can be used to detect the MMPs and can distinguish activated from latent enzyme. (Updated on 25-MAR-2003 to correct PR field.)                                                                                                                                                                                                                                                                                                                    chondrosarcoma cells comprising an amount of a peptide and a pharmaceutical carrier. The invention may be useful for the production of compounds with a cytostatic activity acting as metalloprotease 1 inhibitors, metalloprotease 2 inhibitors, metalloprotease 3 inhibitors, metalloprotease 4 inhibitors, metalloprotease 5 inhibitors, metalloprotease 8 inhibitors, metalloprotease 9 inhibitors, metalloprotease 9 inhibitors, metalloprotease 10 inhibitors, metalloprotease 10 inhibitors, metalloprotease 11 inhibitors, metalloprotease 11 inhibitors or metalloprotease inhibitors, metalloprotease 11 inhibitors or metalloprotease inhibitors. The composition is useful for decreasing and inhibiting the growth of chondrosarcoma size of a bone tumor, useful for treating chondrosarcomas and bone cancers. The present sequence is that
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Matrix metalloprotease; inhibitor; tissue damage; angiogenesis; antibody; arthritis; tumour growth; granulomatous inflammatory condition; enzyme; metastasis; sarcoidosis; antigen.
                                                                                                                                                                     A composition for decreasing and inhibiting the growth of chondrosarcoma cells, useful for treating chondrosarcomas and bone cancer, comprises a matrix metalloproteinase inhibitor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               of a peptide derived from a human matrix metalloproteinase which may be used during the development of a composition of the invention.
                                                                                                                                                                                                                                                                                             This invention relates to a novel composition for inhibiting growth of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         100.0%; Score 60; DB 9; Length 19;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention describes an anti-angiogenic composition (I) for inhibiting expression of vascular endothelial growth factor (VEGF). (I) comprises an effective amount of a peptide inhibitor of matrix metalloproteinase (WMP), where the peptide an inhibit the expression of antidiabetic, ophthalmological and dermatological activities. (I) has cytostatic, vulnerary, cardiant, cerebroprotective, antidiabetic, ophthalmological and dermatological activities. (I) can be used for inhibiting expression of VEGF, and so can be used for inhibiting growth of tumours and diminishing tumours size. The tumour can be matestatic, non-metastatic, vascularised, non-vascularised, hard or soft. (I) is also useful for treating injuries including wounds, surgical incisions, chronic wounds, heart diseases and stroke. (I) is also useful for treating disorders characterised by excessive angiogenesis e.g. macular degeneration and diabetic retinopathy. The present sequence represents a human MMP peptide, which is used in the exemplification of

The inhibitors have peptide sequences related to the cleavage regions of the proenzyme forms of the MMPs. The peptide inhibitors are useful for stimulating cellular proliferation of fibroblasts or keratinocytes, promoting healthy skin development, treating wounds, preventing scarring, improving skin tone, reducing wrinkling and for simulating the development of smooth, healthy skin. The peptide inhibitors are useful as anti-aging and wound healing compounds. The present sequence represents a partial sequence of human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
Novel peptide inhibitor of proteinase activity of matrix metalloproteinases, e.g. matrix metalloproteinase-2, useful for stimulating cellular proliferation of fibroblasts or keratinocytes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

This invention relates to a novel composition for inhibiting growth of chondrosarcoma cells comprising an amount of a peptide and a plarmaceutical carrier. The invention may be useful for the production of compounds with a cytostatic activity acting as metalloprotease 1 inhibitors, metalloprotease 3 inhibitors, metalloprotease 5 inhibitors, metalloprotease 9 inhibitors, metalloprotease 10 inhibitors, metalloprotease 11 inhibitors, metalloprotease 12 inhibitors, metalloprotease 13 inhibitors, composition is useful for decreasing and inhibiting the growth of chondrosarcoma cells which in turn inhibits 10 inhibiting the growth of chondrosarcoma cells which in turn inhibits 10 growth of a bone tumor or diminishes a size of a bone tumor, useful for treating chondrosarcomas and bone cancers. The present sequence is that 10 insequence is composition of the invention.
                                                                                                                                                                                                                                                                                                         A composition for decreasing and inhibiting the growth of chondrosarcoma cells, useful for treating chondrosarcomas and bone cancer, comprises a matrix metalloproteinase inhibitor.
                                                                                                                                                                                                                                                                                                                                                                                 Disclosure, SEQ ID NO 15, 50pp, English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention provides peptides and compositions containing such peptides that are useful as agents to maintain healthy skin and to promote the condition of the skin. The invention is useful for increasing the amount of fibronectin in tissue. The invention is also useful for encouraging the maintenance and development of healthy skin, preventing and treating wrinkles and for treating wounds. The invention acts as vulnerary and dermatological agents. The present sequence is human matrix metalloproteinase (MMP) wound site peptide. This sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Composition used for preventing and treating wrinkles and treating wounds comprises peptide having sequence related to matrix metalloproteinase

The present invention relates to peptide inhibitors of metalloproteinases (MMPs), particularly metalloproteinase-2 (MMP-2). The inhibitors have peptide sequences related to the cleavage regions of the proenzyme forms of the MMPS. The peptide inhibitors are useful for stimulating cellular proliferation of fibroblasts or keratinocytes, promoting healthy skin development, treating wounds, preventing scarring, improving skin tone, reducing wrinkling and for simulating the development of smooth, healthy skin. The peptide inhibitors are useful as anti-aging and wound healing compounds. ABG763121 represent peptide inhibitors of MMPs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Composition used for preventing and treating wrinkles and treating wounds comprises peptide having sequence related to matrix metalloproteinase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention provides peptides and compositions containing such peptides that are useful as agents to maintain healthy skin and to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Fibronectin; healthy skin; wrinkle; wound; vulnerary; dermatological; human; matrix metalloproteinase; MMP.
                                                                                                                                 Novel peptide inhibitor of proteinase activity of matrix metalloproteinases, e.g. matrix metalloproteinase-2, useful for stimulating cellular proliferation of fibroblasts or keratinocytes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human matrix metalloproteinase-2 (MMP2) cleavage region peptide #1.
                                                                                                                                                                                                                                                                                                                                                                                                                                    Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      셤
                                                                                                                                                                                                                                                                                                                                                The present invention describes an anti-angiogenic composition (I) for inhibiting expression of vascular endothelial growth factor (VBGF). (I) comprises an effective amount of a peptide inhibitor of matrix metalloproteinase (WMP), where the peptide can inhibit the expression of VBGF. (I) has cytostatic, vulnerary, cardiant, cerebroprotective, antidabetic, ophthalmological and dermatological activities. (I) can be used for inhibiting expression of VBGF, and so can be used for inhibiting cyrostatic, vascularised, non-vascularised, hard or soft. (I) is also useful for treating injuries including wounds, surgical incisions, chronic wounds, heart diseases and stroke. (I) is also useful for treating disperie retinopathy. The present sequence represents a human MMP cleavage rection peptide, which is used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

                               the amount of fibronectin in tissue. The invention is also useful for encouraging the maintenance and development of healthy skin, preventing and treating wrinkles and for treating wounds. The invention acts as vulnerary and dermatological agents. The present sequence is human matrix metalloprotesinase (MMP) cleavage region peptide. This sequence is used in the exemplification of the invention.
the condition of the skin. The invention is useful for increasing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This invention relates to a novel composition for inhibiting growth of chodrosarcoma cells comprising an amount of a peptide and a pharmacutuical carrier. The invention may be useful for the production of compounds with a cytostatic activity acting as metalloprotease 1 inhibitors, metalloprotease 2 inhibitors, metalloprotease 4 inhibitors, metalloprotease 5 inhibitors, metalloprotease 6 inhibitors, metalloprotease 6 inhibitors, metalloprotease 9 inhibitors, metalloprotease 10 inhibitors, metalloprotease 9 inhibitors, metalloprotease 11 inhibitors, metalloprotease 12 inhibitors, metalloprotease 11 inhibitors, metalloprotease 12 inhibitors, metalloprotease 11 inhibitors, metalloprotease 12 inhibitors, metalloprotease 13 inhibitors, metalloprotease 12 inhibitors, metalloprotease 13 inhibitors, metalloprotease inhibitors, metalloprotease 13 inhibitors, metalloprotease inhibitors, metalloprotease 13 inhibitors, metalloprotease inhibitors, metalloprotease inhibitors, metalloprotease and metalloprotease inhibitors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             A composition for decreasing and inhibiting the growth of chondrosarcoma cells, useful for treating chondrosarcomas and bone cancer, comprises a matrix metalloproteinase inhibitor.
                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     growth; pharmaceutical; cytostatic; metalloprotease 1 inhibitor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human matrix metalloproteinase-2 cleavage region polypeptide SeqID2.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to single exon nucleic acid probes (SENP: see AA131315-AA157546). The present sequence is a peptide encoded by one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of
th of a bone tumor or diminishes a size of a bone tumor, useful for ting chordrosarcomas and bone cancers. The present sequence is that peptide derived from a human matrix metalloproteinase which may be during the development of a composition of the invention.
                                                                                                                                                                                                                                                                                                               Peptide #4866 encoded by probe for measuring placental gene expression.
                                                                                                                  Gaps

measuring human gene expression in a sample derived from human heart (see ABA21535-ABA41305). The present sequence is a protein encoded by one such probe. The probes may be used for predicting, measuring and displaying gene expression in samples derived from the human heart via microarrays. By measuring gene expression, the probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human heart and vascular system e.g. cardiovascular disease. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                       Protein #4665 encoded by probe for measuring heart cell gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Single exon nucleic acid probes for analyzing gene expression in human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to single exon nucleic acid probes for

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   09-AUG-2001
                                                                ABB22666;
```

The invention relates to a spatially-addressable set of single exon nucleic acid probes for measuring gene expression in a sample derived from human lung comprising single exon nucleic acid probes having one of 12614 nucleic acid sequences mentioned in the specification, or their complements or the 12387 open reading frames derived from the 12614 complements or the 12387 open reading frames derived from the 12614 complements or the 12387 open reading frames derived from the 12614 complements or the 12387 open reading frames derived from the 12614 complements or the burnan lung; comprising (a) contacting the array with a sample collection of detectably labeled nucleic acids derived from human lung comprising (a) contacting the array with a collection of detectably labeled nucleic acids from electrons of algorithmically predicting at least one exon from genomic sequences of the eukaryote; and (b) detecting specific hybridisation of detectably algorithmically predicting at least one exon from genomic sequences of the autoritical acids from elekaryote lung mRNA, to a single gene, comprising (a) identifying exons from genomic sequence is included in the above mentioned microarray; assigning exons to a single exon comprising the expression of each of the exons in several comprising the expression of each of the exons in several comprising the expression of each of the exons in the specification, or encoded by the comprising one of 12011 sequences, mentioned in the specification, or encoded by the compression of each of each of the expression in the specification, or encoded by the content of the expression in the specification, or encoded by the expression of each of Human peptide encoded by genome-derived single exon probe SEQ ID 29811. chronic obstructive pulmonary disease; interstitial lung disease; familial idlopathic pulmonary fibrosis; neurofibromatosis; tuberous sclerosis; gaucher's disease; Niemann-Pick disease; Hermansky-Pudlak syndrome; sarcoidosis; pulmonary haemosiderosis; pulmonary histiocytosis; lymphangioleiomyomtosis; Karagener syndrome; pulmonary alveolar proteinosis; fibrocystic pulmonary dysplasia; pulmonary dysplasia; pulmonary dysplasia; pulmonary primary ciliary dyskinesis; pulmonary hypertension; hypline membrane disease. Spatially-addressable set of single exon nucleic acid probes, used to single exon probe; asthma; lung cancer; COPD; ILD; measure gene expression in human lung samples. Also described are: a(n) (expression)vector comprising (I); a host cell genetically engineered to comprise (I) operatively, associated with a regulatory sequence that modulates expression of the polynucleotide in the host cell; an isolated polypeptide comprising a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        peripheral neuropathy; Alzheimers disease; neuroprotective; nootropic; degeneration; parkinsons disease; autiparkinsonian; neurological disease; cerbrovascular ischemia, cerebroprotective; vasotropic; cardiovascular disease; autoimmune disease; immunosuppressive; immune disorder; viral infection; virucide; infection; cancer;
dyskinesis, pulmonary hypertension and hyaline membrane disease. The present sequence is a peptide/protein encoded by a single exon probe of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                vulnerary; CNS-gen.; gene therapy; diagnostic; forensic; mapping; DNA purification; procein purification; osteoarthritis; antiarthritic; osteopathic; musculoskeletal disease; osteoporosis; endocrine disease; periodontal disease; antiinflammatory; mouth disease; burns; injury;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New polynucleotide encoding a polypeptide with biological activity, useful for treating a disease or disorder, e.g. osteoarthritis, burns, CNS and peripheral disease, stroke, autoimmune disorders, viral

sequence of SEQ ID NOS: 568-1134 (fully defined), where the polypeptide cost is: a polypeptide encoded by (I); or a polypeptide encoded by a composition comprising the polypeptide of (3) and a carrier; an antibody directed against the polypeptide of (3) and a carrier; an antibody directed against the polypeptide of (3); a method cor identifying a compound that binds to the collection of polypeptide of (3); a method for identifying a compound that binds to the polypeptide of (3); a method for identifying a compound that binds to the collection of polypeptide of (3); and a collection of polypeptide with biological collection of polypeptide with biological activity, which comprises any of the amino acid sequence of SEQ ID NOS: 1-567. (I) is a polypeptide with biological activity, which comprises any of the amino acid sequence of SEQ ID NOS: 1-567. (I) is a polypeptide with biological activity, which comprises are fully defined in the specification. The sequences and methods are useful in diagnostics, forensic, and general mapping, in identifying of mutations responsible for genetic disorders or other traits, in assessing biodiversity, and for producting many other cypes of data and products dependent on DNA and amino acid sequences. The composition and method are useful for treating a disease or disorder, composition and method are useful for treating a disease or disorder, composition and method are useful for treating a disease or disorder, composition and disease, Alzheimer's disease, burns, CNS and composition and sequence of a novel polypeptide of the invention. This is the amino acid sequence of a novel polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                oiological activity; genetic engineering; hybridisation probe; oligomer; primer; chromosome mapping; gene mapping; recombinant protein production;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New polynucleotides, useful as hybridization probes, oligomers or primers, for chromosome or gene mapping, for the recombinant production of proteins, and for generating antisense DNA or RNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence represents a polypeptide (II) with biological activity, which is encoded by an isolated polynucleotide sequence (I)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

cancer in a patient. Claimed is a vaccine comprising the polypeptide or the nucleic acid encoding the polypeptide. Determining the presence of a lung specific nucleic acid in a sample comprises contacting the sample with a nucleic acid molecule above which will hybridize to a lung specific nucleic acid. A composition consisting of the nucleic acid molecule above which will hybridize to a lung specific nucleic acid. A composition consisting of the nucleic acid molecule or the polypeptide is useful for treating a patient with lung cancer, where the administration induces an immune response against the lung cancer cell expressing the nucleic acid molecule or polypeptide. The nucleic acid molecule and polypeptide are also useful for identifying, tadagnoshing, monitoring, staging, imaging and treating non-cancerous disease states in lung, identifying lung tissue, monitoring and identifying and/or designing (ant) agonists of the polypeptide, and for gene therapy. The present sequence is a human lung specifc protein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to human nucleic acid molecules that are specific to lung cells, lung tissue and/or the lung organ. These lung appecific nucleic acids may be naturally occurring cDNA, genomic DNA, RNA or a fragment, or a non-naturally occurring nucleic acid. Due to alternative splicing and transcriptional modification one lung-specific appen may encode for multiple lung specific RNA s. Specifically claimed is new isolated nucleic acid molecule encoding a protein sequence selected from 83 (SEQ ID NO: 5-5) sequences, and a nucleic acid selected from 5cs (SEQ ID NO: 1-55) sequences. Described is a method of determining the presence of a lung specific nucleic acid or protein in a sample; and a method of diagnosing or monitoring the presence and metastases of lung
from the present invention . Also described: (1) a vector comprising (1); (2) an expression vector comprising (1); (3) a host cell genetically engineered to comprise (1) which is operatively associated with a regulatory sequence that modulates expression of (1) in the host cell; (4) a polypeptide (II) encoded by (1); (5) a composition comprising the polypeptide of (4) and a carrier; (6) an antibody directed against the polypeptide of (4); (7) detecting (1) or the polypeptide of (4) in a sample; (8) identifying a compound that binds to the polypeptide of (4); (9) producing the polypeptide of (4); and a least one of the polymorlecting of the polymorlecting of the polymorlectides sequences (1). The polymorlectides (1) can be used as hybridisation probes.
                                                                                                                                                                                                                                      oligomers or primers, for chromosome or gene mapping, for the recombinant production of proteins, and for generating antisense DNA or RNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New nucleic acid molecule from Homo sapiens, useful for identifying, diagnosing, monitoring, staging, imaging and treating a patient with lung

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PRR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging
                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New isolated polymucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess biodiversity.

A polynucleotide of the invention may have a use in gene therapy. The human diagnostic and therapeutic polynucleotides (dithp) or polypeptides may be used to diagnose a particular condition, disease or disorder associated with human molecules, e.g. cell proliferative disorders,
of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic patent did not appear in the printed specification, but was obtained in ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gietzen D;

autoimmune/inflammatory disorder, developmental disorder, endocrine disorder, neurological disorders, gastrointestinal disorders, or infections caused by virus, bacteria, fungi or parasite. The dithip molecules may also be used in genetic mapping, in identifying individuals from minute blological samples, in detecting single nucleotide polymorphisms, as molecular weight markers, and for somatic or germline gene therapy. The present sequence represents a dithip protein of the invention. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at www.wipo.int/pct/en/sequences/listing.htm
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The original source of the protein material was H-ras transformed human bronchial epithelial cells (TBB-1). The AA sequence was then used to develop oligonucleotide probes which were used to screen a cDNA library of human skin fibroblast mRNA. The longest clone, pGBL 186.2, represented almost the full gelatinase mRNA sequence except the leader sequence exceding the first few AA's of the signal peptide. (Updated on 25-MAR-2003 to correct PF field.) (Updated on 25-MAR-2003 to correct PR field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            DNA encoding human type IV collagenase (gelatinase) - for use in the treatment of hypertrophic scars, keloids and intervertebral disc disease.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               DNA encoding human type IV collagenase (gelatinase) - for use in the treatment of hypertrophic scars, keloids and intervertebral disc disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human type IV collagenase (gelatinase). Protein source was H-ras determined human bronchial epithelial cells (TBE-1). The sequence was determined from clone pdel 186.2 which represents almost the full mRNA sequence. Feature 1 is the N-terminal domain, 1; feature 2 is a middle domain, II, which is organised into 3 x 58 amino acid long head to tail repeats (features 4,5, and 6). These show homology to the type II motif collagen binding domain of fibronectin. Feature 3 is the C-terminal domain. The enzyme could be used in the treatment of hypertrophic scars, Keloids, and intervertebral disc disease. See also AAN91700. (Updated on 25-MAR-2003 to correct PF field.) Type IV procollagenase was purified from human A2058 melanoma cells. The complete amino acid sequence was determined (see also Hoyhtya, M. et al, (1988) FEBS Letters 233, 109-113). Based on this sequence, peptides were synthesised (see features) having homology with a histidine contg. domain at residues 371-386, a cysteine contg. domain at residues 200-370, the 80 tersidue amino terminus or a region 159 residues from the carboxy terminus. These regions correspond to the domain of the enzyme involved in enzyme activation and interaction of the enzyme with the substrate. They can be useful in metalloproteinase detection and inhibition. They can be used in the treatment of inappropriate angiogeness1s, arthritis, tumour growth, invasion and metastasis and granulomatcus inflammatory conditions such as sarciodisis. The peptides can be used to produce antibodise. Peptide 6, at conc. of 0.1 mM inhibited 80% of the correct the patent number format of US Government-owned NTIS submitted to correct the patent number format of US Government of Evident numbers. For further information please visit the Derwent web site at www.derwent.com/dwpi/updates/fitis us.html.) (Updated on 25-MAR-2003 to correct PA field.) (Updated on 25-MAR-2003 to correct PI field.)
                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Matrix metalloprotease; inhibitor; tissue damage; angiogenesis; antibody; arthritis; tumour growth; granulomatous inflammatory condition; enzyme; metastasis; sarcoidosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Matrix metallo:proteinase peptide(s) - used to inhibit enzyme in treating tissue damage caused by activated enzyme.

The present sequence represents the mature protein of human matrix
metalloprotease-2 (MMP-2). Fragments of this protein (AAW41228-33) are
able to act as alpha-v-beta-5 antagonists. Alpha-v-beta-5 is a
correctin receptor. Inhibitors of alpha-v-beta-5 can inhibit
an inhibitor of anglogenesis i.e. an alpha-v-beta-5 antagonising
contains an inhibitor of anglogenesis i.e. an alpha-v-beta-5 antagonising
polypeptide that binds to integrin alpha-v-beta-5 antagonising
contains an inhibitor of integrin alpha-v-beta-5 antagonising
contains an inhibitor of sugiogenesis i.e. an alpha-v-beta-5 antagonising
contains an inhibitor of sugiogenesis or metagonises are used to inhibit
conjuganesis in inflamed tissue, in solid tumours or metagtases, and in a
conjuganesis in inflamed tissue, or corneal transplants). They are
conjugantly used to induce regression or to inhibit growth of tumours.
Confidently used to induce regression or to inhibit growth of tumours.
Confidently used to induce regression or to inhibit growth of tumours.
Considently used to induce regression or to inhibit growth of tumours.
Considently used to induce regression or to inhibit growth of tumours.
Considently used to induce regression or to inhibit growth of tumours.
Considently used to induce regression or to inhibit growth of tumours.
Considently used to induce regression or to inhibit growth of tumours.
Considently maderal muscle cells following angloplasty and to reduce blood supply to selected tissues. The antagonists particularly
                                                                                                                                                                                                                                                                                                                                                   ö
                                                                 MWPB, e.g. for treating inappropriate angiogenesis, arthritis, tumour growth, invasion and metastasis and granulomatous inflammatory conditions such as sarcoidosis. Antibodies to the peptides can be used to detect the MMPB and can distinguish activated from latent enzyme. (Updated on 25-MAR -2003 to correct PR field.)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Matrix metalloprotease-2; MMP-2; alpha-v-beta-5 antagonist; treatment; vitronectin receptor; inhibition; angiogenesis; integrin; tumour growth; restenosis; neovascularisation.
       zymogen (precursor protein). The invention relates to MMP inhibitor peptides which can be used to treat tissue damage caused by activated MMPs, e.g. for treating inappropriate andiomensis anti-tissue damage.
sequence represents a human type IV matrix metalloprotease (MMP)
                                                                                                                                                                                                                                                                                                                                                      Gapa

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 in blocking cancer invasion and metastasis. The invention relates to matrix metalloproteinase-2 (MMP-2) peptides. The synthetic oligopeptides are useful as pharmaceutical compositions for blocking or treating cancer invasion and metastases in a human patient. In particular, they are useful for treating brain cancer, lung cancer, skin cancer or breast cancer. The oligopeptides are also useful as vaccines for preventing these cancers, enhancing immune response or raising antibodies for assays used to diagnose diseases involving matrix metalloproteinases or clinical monitoring of the progression or regression of disease. They are also useful in gene therapy. The present sequence is the human MMP-2 protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New synthetic oligopeptide, useful for blocking or treating cancer
invasion and metastases in a human patient, particularly as a vaccine for
treating or preventing diagnosing brain cancer, lung cancer, skin cancer
or breast cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     present invention relates to novel synthetic oligopeptides effective
inhibit neovascularisation where this is induced by cytokines, e.g. transforming growth factor alpha, epidermal growth factor or especially vascular endothelial growth factor
                                                                                                                                            Gaps

The invention relates to a method of inhibiting angiogenesis in a tissue by the administration of a composition comprising an organic peptidomimentic antegorise of integrin alpha-V beta-3 (vitronectin receptor). The integrin alpha-V beta-3 antegonist and compositions containing it are useful for inhibiting angiogenesis in a variety of medical conditions. The antagonist may be used to induce the regression of solid tumours or solid tumour metastases; to inhibit the growth of solid tumours undergoing neovascularisation; to treat inflamed tissue in which neovascularisation is occurring (e.g., in rheumatoid arthritis); to treat neovascularisation in retinal tissue (e.g., in diabetic retinopathy); to treat restenosis in a tissue by inhibiting smooth muscle cell migration (such as that which occurs following angioplasty); and to treduce the blood supply to a tissue required to support new growth of the tissue. The present sequence represents human mature matrix
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Administration of composition comprising organic peptidomimetic alpha-v
beta-3 antagonist to e.g. inhibit angiogenesis (inflamed tissue
angiogenesis, retinal angiogenesis and tumor angiogenesis) in a tissue.
                                                                                                                                                                                                                                    vitrofictin receptor antagonist; nedvascularisation; cancer; tumour; inflammation; rheumatoid arthritis; retina; diabetic retinopathy; restenosis; smooth muscle cell migration; angioplasty; antiangiogenic; cytostatic; antiinflammatory; antiarthritic; antirheumatic; ophthalmological; antidiabetic; vasotropic; muscular-gen.; peptidomimetic; matrix metalloprotease 2; MMP-2; gelatinase; human;

The integrin alpha-V beta-3 antagonist and compositions containing it are useful for inhibiting angiogenesis in a variety of medical conditions. The antagonist may be used to induce the regression of solid tumours or solid tumour metastases, to inhibit the growth of solid tumours undergoing neovascularisation; to treat inflamed tissue in which neovascularisation is occurring (e.g., in rheumatoid arthritis); to treat neovascularisation in retinal tissue (e.g., in diabetic retinopathy); to treat restences in a tissue by inhibiting smooth muscle cell migration (such as that which occurs following angioplasty); and to reduce the blood supply to a tissue required to support new growth of the tissue. The present sequence represents mouse mature matrix
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Administration of composition comprising organic peptidomimetic alpha-v beta-3 antagonist to e.g. inhibit angiogenesis (inflamed tissue angiogenesis, retinal angiogenesis and tumor angiogenesis) in a tissue.

The present sequence is that of human matrix metalloproteinase-2 (WMP-2), previously known as 72 kDa gelatinase and gelatinase A. MMP-2 is capable of degrading the extracellular matrix components of the basement membrane. The invention relates to methods for treating pain in a patient of mainistration of an inhibitor of MMP-2 and MMP-9 (see AAB20491). The administration of an inhibitor of MMP-2 is useful for treating nerve clasue damage (claimed), where the patient is suffering from a disease or isonaer selected from stroke, haemorrhage, reperfusion injury, cerebral isonaer selected from stroke, haemorrhage, reperfusion injury, crebral isonaer selected from stroke, namorrhage, reperfusion injury, crebral creating a disease, disorder or nerve tissue damage selected from enhanced or exaggerated sensitivity to acute pain, burn pain, atypical enhanced or exaggerated sensitivity to acute pain, burn pain, atypical and II, arthritic pain, sports injury pain, pain related to virus infection, post-herpetic neuralgia, phantom limb pain, labour pain, conditions/visceral pain, neuralgia, painful diabetic retinopathy, conditions/visceral pain, neuralgia, painful diabetic retinopathy, craumetic nerve injury, and tolerance to narcotics or withdrawal from arcotics (claimed). WMP-2 polypeptides can also be used to screen for
                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Polypeptide for the treatment of pain and the reduction of tissue damage comprises an inhibitor of human matrix metalloproteinase.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The specification describes a pharmaceutical composition, comprising a growth factor, an inhibitor agent, i.e. a protease. The inhibitor agent inhibits the action of at least one specific adverse protein, i.e. a protease, that is upregulated in a damaged tissue such as a wound environment. Growth factors which are included in the composition of the invention are platelet-derived growth factor (FDGF), fibroblast growth factor (FGF), connective tissue derived growth factor (CTGF), reansforming growth factor-beta (TGF-beta), granulacyte macrophage colony stimulating factor (GM-CSF), and chrysalin. Inhibitors which are included in the composition of the invention include inhibitors of uroxinase-type plasminosen activator (UMPA) and matrix metalloproteinase (MMP). The composition is useful for the treatment of chronic damaged tissue, i.e. wounds and dermal ulcers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                sequence represents a human MMP-2, and is used to produce the

MMP-25 DNA is located on chromosome 11q22. Marrix metalloproteinases are a family of zinc dependent endopeptidases that function extracellularly to degrade proteins typically found in the extracellular matrix. MMP-25 is expressed in skin cells of mammals, particularly in breast cells and hair encoding all or part of MMP by hybridising MMP-25 to a nucleic acid molecule encoding all or part of MMP by hybridising MMP-25 to a nucleic acid sample and identifying a sequence that hybridises in the nucleic acid sample. The identification step involves performing polymerase chain reaction (PCR) to amplify the hybridising sequence. MMP-25 antibody is useful for identifying type 25 MMP. WMP-25 protein inhibitors may be used to modulate hair growth and breast cancer in a mammal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           present sequence is human matrix metalloproteinase (MMP)-2 protein
                                                                                                                                                                                                                                                                                                                                                                                                Novel isolated matrix metalloproteinase-25 nucleic acid molecule and proteins encoded by them whose inhibition is useful for modulation of hair growth in mammals.

The invention relates to peptides (ABB79414-ABB79426) derived from the C-
terminal fragment PEX of matrix metalloprotease-2 (MMP-2). Matrix MMP-2
C derivatives of formula X-Y-Z (I) and their salts and solvates are
C described. X = H, 1-10C alkanoyl or peptide fragment consisting of 1-20
naturally occurring amino acid residues; Y = peptide fragment selected
CC from the sequence region 466.660 of human Pro-MMP-2; and Z = OH, NH 2, NH
C-1-10C alkyl N(1-10C alkyl)_Z or peptide fragment consisting of 1-20
c naturally occurring amino acid residues. Primary amino groups are
CC optionally protected conventionally. The peptides and MMP-2 derivatives
CC optionally protected conventionally. The peptides and MMP-2 derivatives
CC optionally pathological processes supported or propagated by
angiogenesis, thrombosis, cardiac infaction, coronary heart disease,
CC especially pathological processes supported or propagated by
angiogenesis, thrombosis, cardiac infaction, coronary heart disease,
CC arteriosclerosis, tumours, osteoporosis, fibrosis, inflammation,
cc angiogenesis, thrombosis, osteoporosis, fibrosis, inflammation,
infections, psoriasis or wound healing deficiency. More generally the
peptides and MMP-2 derivatives are useful in human and veterinary
medicine for the treatment and/or prophylaxis of thrombosis, myocardial
infarction, apoplexy, angina pectoris, tumour diseases, osteolytic
diseases (e.g. osteoporosis or hypercalcemial, pathological angiogenic
CC diseases (e.g. inflammation), ophthalmological diseases (e.g. diabetic
crubectic glaucoma), rhematoin arthritis, ulecanic angioplasty, viral, bacterial or fungal infections, acute renal failure
CC orlutis, Crohm's disease, atherosclerosis, psoriasis, restenosis after
angioplasty, viral, bacterial or fungal infections, acute renal failure
CC or wound healing deficiency; as antimicrobial/antiseptic agents in
CC operations involving biomaterials, implants, catheres or cardiac
coperations involving biomaterials, implants, catheres or cardiac
cc that of the human MMP-2 p
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New matrix metalloprotease-2 derivative peptides, are alpha-v-beta-3 integrin receptor inhibitors useful e.g. for treating thrombosis, cardiac infarction, tumors, osteoporosis, inflammation or infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            100.0%; Score 60; DB 5; Length 660; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to an isolated molecule comprising an antibody variable region which specifically binds to an extracellular domain of a tumour endothelial marker (TEM) protein selected from ABB90732, ABB90740, ABB90749, ABB90750 and ABB90769. The antibodies which bind to TEM proteins have cytostatic, immunostimulant and antiangiogenesis in subjects peating a vescularised tumour, polycystic kidney disease, diabetic retinopathy, rheumatoid arthritis and psoriasis. Human, mouse and rat TEM genes and the encoded proteins (ABI22075-ABI29141 and ABB90721-ABB90789) are disclosed, as are marker oligomucleotide sequences: tumour endothelial markers (TEM) ABL92196-ABL92041 and ABL92143-ABL92191; normal endothelial markers (NEM) ABL92042-ABL92041, and pan-endothelial markers
                                                                                                                                 Human; mouse; rat; TEM; tumour endothelial marker; NEM; PEM; cytostatic; normal endothelial marker; pan-endothelial marker; immunostimulant; antiangiogenic; tumour; neoangiogenesis; vascularised tumour; polycystic kidney disease; diabetes; retinopathy; rheumatoid arthritis; psoriasis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                           An isolated molecule comprising an antibody variable region which specifically binds to an extracellular domain of a tumor endothelial marker (TEM) protein, useful for inhibiting tumor growth.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

The present invention relates to a method for diagnosing breast cancer in a subject suspected of having endometrial cancer. The method comprises determining the expression of a set of human genes or expression products in an endometrial sample suspected of being cancerous. The human genes of the invention are differentially expressed in breast tumours characterised as high or low MAI (mitotic activity index). These sets of genes can be used to discriminate between high and low MAI breast tumours. The invention also provides DNA and protein microarrays for analysing the expression of the human genes and their products. The methods and arrays are useful for the diagnosis and prognosis of endometrial cancer, selecting and monitoring treatment regimes, and identification of compounds useful for the treatment of endometrial cancer. AAUB4311-AAUB4311 for the human proteins of the invention that are differentially expressed in breast cancer tissue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Diagnosing breast cancer comprises determining expression of nucleic acid molecules or expression products that are differentially expressed in normal and malignant tissue.
                                                                                                                                                         Human; diagnosis of breast cancer; endometrial cancer; breast tumour;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gapa
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human, endothelial cell; EC; tumour endothelial cell; TEM; NEM;

The present invention describes an anti-angiogenic composition (I) for inhibiting expression of vascular endothelial growth factor (VEGF). (I) comprises an effective amount of a peptide inhibitor of matrix metalloproteinase (MMP), where the peptide can inhibit the expression of YEGF. (I) has cytostatic, vulnerary, cardiant, cerebroprotective, antidiabetic, ophthalmological and dermatological activities. (I) can be used for inhibiting expression of YEGF, and so can be used for inhibiting growth of tumours and diminishing tumours size. The tumour can be metastatic, non-metastatic, vascularised, non-vascularised, hard or soft. (I) is also useful for treating injuries including wounds, surgical incisions, chronic wounds, heart diseases and stroke. (I) is also useful for treating disorders characterised by excessive angiogenesis e.g. macular degeneration and diabetic retinopathy. The present sequence represents the human MMP-2 protein, which is used in the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; enzyme; crystalline polypeptide; matrix metalloproteinase 9; MMP9; gelatinase; metalloproteinase mediated disease; drug design; arthritis; three-dimensional structure; MMP9 inhibitor; tumour growth; cancer metastasis; osteoarthritis; atherosclerosis; restenosis; periodontitis; multiple sclerosis; glomerulonephritis; MMP9 modulator; graft-versus-host disease; non-insulin dependent diabetes; MMP2;
                                                                                                                                                                                                                                                                                                                                                                         Anti-angiogenic composition comprising peptide inhibitor of matrix metalloproteinase, useful for decreasing the expression of vascular endothelial growth factor and treating cancers and tissue injuries.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          100.0%; Score 60; DB 6; Length 660; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New purified human transmembrane protein, designated as tumor endothelial marker (TEM) 3, useful for detecting, diagnosing or treating tumors, polycystic kidney disease, diabetic retinopathy, rheumatoid arthritis or psoriasis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; matrix metalloproteinase; MMP; anticancer; wound healing; matrix metalloproteinase inhibitor; antitumour; antiangiogenic; cardiant; vascular endothelial growth factor inhibitor; VEGF inhibitor; cytostatic; vulnerary; cerebroprotective; antidiabetic; ophthalmological; tumour; dermatological; metastatic; non-metastatic; vascularised; heart disease; non-vascularised; surgical inclsion; chronic wound; stroke; angiogenesis; macular degeneration; diabetic retinopathy; cleavage region.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to a novel method for the isolation of endothelial cells (ECs), and the identification of genes expressed in normal and tumour ECs. Tumour endothelial marker (TEM), normal endothelial marker (TEM), normal identified in human ECs. The human EC marker proteins and the polymucleotide sequences encoding them are useful for detecting, diagnosing or treating tumours as well as polycystic kidney disease, diabetic retinopathy, rheumatoid arthritis, and psoriasis. They are also useful for inhibiting neoangiogenesis or tumour anglogenesis, for inducing an immune response to tumour endothelial cells in a patient, or for identifying candidate drugs for treating tumours. The present for identifying candidate drugs for treating tumours. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

The present invention relates to peptide inhibitors of metalloproteinases (MMPs), particularly metalloproteinase-2 (MMP-2). The inhibitors have peptide sequences related to the cleavage regions of the proenzyme forms of the MMPS. The peptide inhibitors are useful for stimulating cellular prollferation of fibroblasts or keratinocytes, promoting healthy skin reducing metaling and for smallating the development treating wounds, preventing scarring; improving skin tone, reducing wrinking and for simulating the development of smooth, healthy skin skin. The peptide inhibitors are useful as anti-aging and wound healing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New substantially purified polypeptide, useful for diagnosing or treating a hypoxia-regulated condition, such as cancer, ischemia, reperfusion injury, retinopathy, pre-eclampsia, atherosclerosis, inflammation, or wound healing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             human; disease state; cytostatic; antiinflammatory; ophthalmological; antiarteriosclerctic; vulnerary; gene therapy; hypoxia-regulated condition; tumourigenesis; angiogenesis; apoptosis; inflammation; erythropoiesis; glycolysis; gluconeogenesis; glucose transportation; catecholamine synthesis; iron transport; nitric oxide synthesis; cancer; ischaemic condition; reperfusion injury; retinopathy; neonatal stress; pre-eclampsia; atherosclerosis; inflammatory condition; wound healing.
                                                                                      Novel peptide inhibitor of proteinase activity of matrix metalloproteinase.2, useful for stimulating cellular proliferation of fibroblasts or keratinocytes.
                                                                                                                                                                                                                                                                                                                                                                                                                        100.0%; Score 60; DB 6; Length 660; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention comprises a crystalline form of a polypeptide corresponding to the catalytic domain of matrix metalloproteinase 9 (MMP9) protein - a gelatinase. The crystalline polypeptide of the invention is useful for treating a metalloproteinase mediated disease or condition in a warm-blooded animal. The crystalline polypeptide is also useful for cherming the three-dimensional structure of the MMP9 catalytic domain is useful for rational drug design, and the atomic coordinates of the catalytic domain is useful for rational drug design, and the atomic coordinates of the Companies of preferance of preferance of preferance of preferance of many preferance of preferance of preferance of preferance of preferance of many preferance or condition, such as: tumour growth; metalloproteinase mediated disease or condition, such as: tumour growth; metalloproteinase mediated disease or condition, such as: tumour growth; metalloproteinase series and non-insulin dependent diabetes. The present metalloproteinase 2 (MMP2) amino acid sequence represents a human matrix metalloproteinase 2 (MMP2)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                               Novel crystalline form of a polypeptide corresponding to the catalytic domain of matrix metalloproteinase 9 protein, useful for selecting or designing chemical modulators which are used for treating diabetes,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; peptide inhibitor; matrix metalloproteinase-2; MMP-2; cleavage region; proenzyme form; cellular proliferation; fibroblast; keratinocyte; healthy skin development; wound healing; scarring; skin tone; wrinkle; anti-aging; vulnerary.

This invention relates to novel human genes and gene product which are implicated in certain disease states. Compounds which modulate the proteins of the invention may have cytostatic, antiinflammatory. Ophthalmological, antiarteriosclerotic or vulnerary activities. The sequences of the invention may be useful for gene therapy. The invention may be useful for gene therapy. The invention may be useful for diagnosing or treating a hypoxia-regulated condition, such as tumourigenesis, angiogenesis, apptosis, inflammation, erythropoiesis, or the biological response to hypoxia conditions including processes such as glycolysis, gluconeogenesis, glucose transporterion, catecholamine synthesis, iron transport or nitric oxide synthesis. The disease includes cancer, ischaemic conditions, reperfusion injury, retinopathy, neonatal stress, pre-eclampsia, atherosclerosis, inflammatory, conditions, reconsistinflammatory.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 a disease related protein of the invention.

Diagnosing and analyzing autoimmune disease using gene expression profiles and microarray technology, useful for diagnosing and treating rheumatoid arthritis, lupus, fibrositis, osteoarthritis, fibromyalgia and gout.

Disclosure; Page; 56pp; English.

The invention relates to a novel method for diagnosing and analysing autoimmune disease or arthritides. The method comprises obtaining a patient sample containing mRNA, analysing gene expression using the mRNA

that results in a gene expression signature of the mRNA, and using that gene expression signature to diagnose or analyse the autcimmune disease or arthritides in the patient, where gene expression of at least 60% of the genes correlates with that of the gene signature. The invention of further comprises: a treatment of rheumatoid arthritis; identification of genes for targeting in the treatment of rheumatoid arthritis; in a mammal other than a mouse; diagnosis of rheumatoid arthritis; in a mammal array or gene chip, specific for rheumatoid arthritis; diagnosis or analyses of autoimmune disease or rheumatoid arthritis; sceening the efficacy of a candidate drug in vitro for the treatment of collageninduced arthritis; and reducing the symptoms associated with collageninduced arthritis. The compositions of the invention have the following activities: immunosuppressive, antirheumatic, antiarthritic, osteopathic, antigout, antinflammatory, dermatological, and immunomodulatory. The methods and compositions of the present invention are useful for diagnosing and treating autoimmune disease or arthritides, such as rheumatoid arthritis, lupus, ankylosing spondylitis, fibrositis, and immune disease caused by an infectious agent. This sequence represents a protein sequence relating to the genes used in the analysis and treatment of autoimmune diseases or arthritides. Note: This sequence is not shown in the specification. It has been supplied in an electronic format from

The invention is useful for increasing the amount of fibronectin in itssue. The invention is also useful for encouraging the maintenance and development of healthy skin, preventing and treating winkles and for treating wounds. The invention acts as vulnerary and dermatological agents. The present sequence is human matrix metalloproteinase-2 (MMP2) protein. This sequence is used in the
                                                                cells from the niches they normally occupy. The invention is useful for recruiting adult stem cells for treating bone marrow failure disorder such as applastic anaemia and myeloproliferative disorder such as multiple myeloma. The invention is also useful in gene therapy. The present sequence is human matrix metalloproteinase (MMP) protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Composition used for preventing and treating wrinkles and treating wounds comprises peptide having sequence related to matrix metalloproteinase
                                               present invention relates to the use of proteases to recruit stem
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Fibronectin, healthy skin; wrinkle; wound; vulnerary; dermatological; human; matrix metalloproteinase; MMP.

The invention relates to the use of a protease with defined specificity for a target substrate for preparing a medicament for the treatment of a specific disease related to the target substrate. The invention also relates to a pharmaceutical or diagnostic composition comprising one or diagnostically acceptable carriers, excipients and/or auxiliary agents, and a method for cleaving a target substrate with a protease as cited in the use mentioned, and a method for treatment of a disease in a patient connected with a specific target substrate comprising administering to the parient of the protease with defined specificity for the specific target substrate comprising administering to the parient one or more biological activities, physico-chemical properties or pharmacological properties of the target protein and/or activates or increases one or more biological activities, physico-chemical properties or increases one or more biological activities, physico-chemical properties or increases one or more biological activities, physico-chemical properties or increases one or more biological activities, physico-chemical properties or increases one or more biological properties of the target protein and/or adds one or physical properties of the target protein, and/or adds one or physical properties of the target protein, and/or adds one or physical properties of the target protein, and/or adds one or physical properties of the target protein, and/or adds one or physical properties of the target protein, and/or adds one or physical properties of the target protein, and/or adds one or physical properties or the protein and physical properties or the properties or the protein and physical properties or the protein and physical properties or physical protein and physical properties or physical protein and physical protein and physical protein and physical protein and physica
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           growth disorder; respiratory disease; genitourinary disease; gynecological disorder; nutritional disorder; infection; cytostatic; gynecological disorder; nutrificanal cytostatic; antianthatic; antigenthatic; antigenthatic; antigenthic; anticological; nephrotropic; cardiovascular-gen.; lumunosuppressive; respiratory-gen.; antipsoriatic; antiallergic; dermatological; enzyme; hydrolysis.

chondrosarcoma cells comprising an amount of a peptide and a pharmaceutical carrier. The invention may be useful for the production of compounds with a cytostatic activity acting as metalloprotease 1 inhibitors, metalloprotease 2 inhibitors, metalloprotease 3 inhibitors, metalloprotease 5 inhibitors, metalloprotease 5 inhibitors, metalloprotease 7 inhibitors, metalloprotease 9 inhibitors, metalloprotease 1 inhibitors, metalloprotease 1 inhibitors, metalloprotease 11 inhibitors, metalloprotease 11 inhibitors, metalloprotease 11 inhibitors or metalloprotease 12 inhibitors, metalloprotease 13 inhibitors or metalloprotease inhibitors, metalloprotease 13 inhibitors or metalloprotease inhibitors, metalloprotease 13 inhibitors or metalloprotease inhibitors, metalloprotease 12 inhibitors, metalloprotease 13 inhibitors or metalloprotease 12 inhibitors, metalloprotease 13 inhibitors or metalloprotease 12 inhibitors, metalloprotease 13 inhibitors or metallopro
                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        A composition for decreasing and inhibiting the growth of chondrosarcoma cells, useful for treating chondrosarcomas and bone cancer, comprises a matrix metalloproteinase inhibitor.
neurodegenerative diseases, growth disorders, respiratory diseases, genitourinary diseases, gynecological disorders, nutritional disorders and infections. This sequence represents a polypeptide hydrolysed by a protease used in the scope of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This invention relates to a novel composition for inhibiting growth of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        cell growth; pharmaceutical; cytostatic; metalloprotease 1 inhibitor; metalloprotease 2 inhibitor; metalloprotease 3 inhibitor; metalloprotease 4 inhibitor; metalloprotease 5 inhibitor; metalloprotease 6 inhibitor; metalloprotease 7 inhibitor; metalloprotease 8 inhibitor; metalloprotease 9 inhibitor; metalloprotease 10 inhibitor; metalloprotease 11 inhibitor; metalloprotease 12 inhibitor; metalloprotease 13 inhibitor; metalloprotease 13 inhibitor; metalloprotease 14 inhibitor; metalloprotease 15 inhibitor; metalloprotease 16 inhibitor; metalloprotease 17 inhibitor; metalloprotease 18 inhibitor; metalloprotease 19 inhibitor;

The invention discloses a composition comprising two or more isolated rat cor human polynucleotides or a polynucleotide which represents a fragment, cor human polynucleotides or a polynucleotide acid sequence. Also claimed are a vector comprising the novel polynucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a kit to perform the method, an array, a method for identifying an agent that is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound which regulates the expression of a polynucleotide sequence which is differentially expressed in an animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the compound that regulates the activity of one or more of the compound that regulates the activity of one or more of the compound that regulates the activity of one or more of the compound useful in treating a cativity in an animal of one or more of the polypeptides given in the specification, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more or more or more or more or more or polypeptides or the compound that comply plan and a pharmaceutical composition comprising the one or more or 
                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Rat; pain; neuronal tissue; gene therapy; spinal segmental nerve injury; chronic constriction injury; CCI; spared nerve injury; SNI; Chung.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New composition comprising two or more isolated polypeptides, useful for preparing a medicament for treating pain in an animal.
                                                                                                                                             Gaps

The invention discloses a composition comprising two or more isolated rat or human polymucleotides or a polymucleotide which represents a fragment, derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the nucleic acid sequence. Also claimed are a vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a kit to perform the method, an array, a method for identifying an agent that increases or decreases the expression of the polymucleotide sequence that increases or decreases the expression of the polymucleotide sequence the is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound which regulates the expression of a polymucleotide sequence which is differentially expressed in an animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the polymucleotides, a method for producing a pharmaceutical composition, a method for identifying a compound or small molecule that regulates the activity in an animal of one or more of the polympetides given in the specification, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more
                                                                                                                                                                                                         ö
therapy). The sequence presented is a rat protein (shown in Table 2 of the specification) which is differentially expressed during pain. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic form directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Rat; pain; neuronal tissue; gene therapy; spinal segmental nerve injury; chronic constriction injury; CCI; spared nerve injury; SNI; Chung.

ö
polypeptides or their antibodies. The polynucleotide or the compound that modulates its activity is useful for preparing a medicament for treating pain (e.g. spinal segmental nerve injury (Chung), chronic constriction injury (CCI) and spared nerve injury (SNI)) in an animal (e.g. gene therapy). The sequence presented is a rat protein (shown in Table 2 of the specification) which is differentially expressed during pain. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic form directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This protein sequence comprises chicken matrix metalloproteinase-2 (chMMP -2). The invention relates to the discovery that angiogenesis is mediated by the specific vitronectin receptor alpha-v beta-3, and that inhibition of alpha-v beta-3 function inhibits angiogenesis. Claimed antagonists of alpha-v beta-3 include C-terminal fragments (see AAW41083-94) of human or chicken MMP-2. An MMP-2 fragment can be obtained by recombinant DNA methods, such as PCR amplification of the chMMP-2 coding region, cloning into e.g. pGBX-3X, and expression in B. coli as a fusion protein with glutathione-S-transferases. The antagonists can be used to inhibit
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Packaging material containing polypeptide antagonist of alphav, beta3 integrin - used for inhibition of angiogenesis, and for treating tumours,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence represents the chicken matrix metalloprotease-2 (MMP c -2) protein sequence. Fragments of this protein (AAW41234-39) are able to act as alpha-v-beta-5 ancagoniates. Alpha-v-beta-5 as a vitronectin receptor Inhibitors of alpha-v-beta-5 can inhibit angiogenesis. The specification describes a novel labelled package that contains an contraction describes a novel labelled package that contains an contraction describes a novel labelled package that contains an contraction describes a novel labelled package that contains an contraction describes an alpha-v-beta-5 antagoniating polypeptide that binds to integrin alpha-v-beta-5 and includes a part of the C-c terminal domain of MMP. The antagoniate are used to inhibit angiogenesis in inflamed tissue, in solid tumours or metastases, and in a wide range c of ocular disorders (e.g. diabetic or other forms of retinopathy, neovascular glaucoma, or corneal transplants). They are particularly used to induce regression or to inhibit growth of tumours. The alpha-v-beta-5 antagonists can also be used to treat restenosis caused by migration of smooth muscle cells following angioplasty and to reduce blood supply to selected tissues. The antagonists strictularly inhibit neovascularisation where this is induced by cytokines, e.g. transforming growth factor a physic endocreen a physic endocrement or sepecially vascular endothelial growth
                                                                                                                                                                                                                                           ö
angiogenesis in inflammed tissue (for treatment of arthritis or rheumatoid arthritis), in solid tumours or metastases (particularly to induce regression or inhibit tumour growth), and in ocular disorders such as diabetic retinopathy and macular degeneration, as well as to treat restenosis (all claimed)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Packaging material containing polypeptide antagonist of alphav, beta5
integrin - used for inhibition of angiogenesis, and for treating tumours,
inflammation, eye diseases etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Matrix metalloproteage-2; MMP-2; alpha-v-beta-5 antagonist; treatment; vitronectin receptor; inhibition; angiogenesis; integrin; tumour growth; restenosis; necovascularisation.

                                                                                                 The invention relates to a method of inhibiting angiogenesis in a tissue by the administration of a composition comprising an organic peptidomimetic antagonist of integrin alpha-V beta-3 virtonectin receptor). The integrin alpha-V beta-3 antagonist and compositions containing it are useful for inhibiting angiogenesis in a variety of medical conditions. The antagonist may be used to induce the regression of solid tumours or solid tumour metastases; to inhibit the growth of solid tumours undergoing neovascularisation; to treat inflamed tissue in which neovascularisation in retinal tissue (e.g., in diabetic retinopathy); to treat restenosis in a tissue by inhibiting smooth muscle celuce the blood supply to a tissue required to support new growth of the tissue. The present sequence represents chicken matrix metalloprotease 2 (MMP-2, gelathiase) used in an example of the invention. Note: The present sequence differs between residues 202-205 compared to the present sequence residues 202-205 compared to the
                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           peptidomimetic; matrix metalloprotease 2; MMP-2; progelatinase; chicken;
                                Administration of composition comprising organic peptidomimetic alpha-v beta-3 antagonist to e.g. inhibit angiogenesis (inflamed tissue angiogenesis, retinal angiogenesis and tumor angiogenesis) in a tissue.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Anglogenesis inhibitor; integrin alpha-V beta-3 antagonist; vitronectin receptor antagonist; neovascularisation; cancer; tumour; inflammation; rheumatod arthritis; retina; diabetic retinopathy; restenosis; smooth muscle cell migration; angioplasty; antianglogenic; cytostatic; antiinflammatory; antiarthritic; antiirheumatic; ophthalmological; antidiabetic; vasotropic; muscular-gen;

The invention relates to a method of inhibiting angiogenesis in a tissue by the administration of a composition comprising an organic by the administration of a composition comprising an organic peptidomimetic antagonist of integrin alpha-V beta-3 aviatomectin receptor). The integrin alpha-V beta-3 antagonist and compositions containing it are useful for inhibiting angiogenesis in a variety of medical conditions. The antagonist may be used to induce the regression of solid tumnours or solid tumnour metastases; to inhibit the growth of solid tumnours undergoing neovascularisation; to treat inflamed tissue in which neovascularisation is occurring (e.g., in rheumatoid arthritis); to treat neovascularisation in retinal tissue (e.g., in diabetic retinopathy; to treat restenosis in a tissue by inhibiting smooth muscle cell migration (such as that which occurs following angioplasty); and to reduce the blood supply to a tissue required to support new growth of the cissue. The present sequence represents chicken matrix metalloprotease 2 (MMP-2, gelatinase) used in an example of the invention. Note: The present sequence differs between residues 202-205 compared to the sequence listing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Administration of composition comprising organic peptidomimetic alpha-vbeta-3 antagonist to e.g. inhibit angiogenesis (inflamed tissue angiogenesis, retinal angiogenesis and tumor angiogenesis) in a tissue.
                                                                                                                                     /note= "Corresponds to residues 410-637 of the mature protein (see SEQ ID NO:23)"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  /note= "Corresponds to residues 549-637 of the mature protein (see SEQ ID NO:28)"
                                                                                                                                                                                                                                                                                                                                                                                                     /note= "Corresponds to residues 445-552 of the mature
protein (see SEQ ID NO:26)"

The present invention describes isolated polynuclectide sequences (I), which encode polypeptides (II) with biological activity. Also described:
(I) a vector comprising (I); (2) an expression vector comprising (I); (3)
a sociated with a regulatory sequence that modulates expression of (I) in the host cell; (4) a polypeptide (II) encoded by (I); (5) a composition comprising the polypeptide of (4) and a carrier; (6) an antibody directed against the polypeptide of (4); (7) detecting (I) or the polypeptide of (3); and (10) a collection of polymentiang the polypeptide of (4); and (10) a collection of polymuclectides comprising at least one of the polymuclectide sequences (I). The polynuclectides (I) can be used as hybridisation probes, oligomers or primers, for chromosome or gene mapping, for the recombinant production of proteins, and for generating antisense DNA or RNA. The present sequence represent a human contig polypeptide sequence, which is used in an example from the present invention.

New polynucleotide encoding a polypeptide with biological activity, useful for treating a disease or disorder, e.g. osteoarthritis, burns, CNS and peripheral disease, stroke, autoimmune disorders, viral infection, or cancer.

Example 3; SEQ ID NO 1664; 500pp; English.

The invention describes a new isolated polynucleotide (I) encoding a polypeptide with biological activity comprising: a nucleotide sequence of SRQ INIJY defined); a nucleotide sequence that hybridizes to the sequence of (I) under stringent hybridization conditions; or a nucleotide sequence having greater than 99% sequence identity with the sequence of (I). Also described are: a(I) (expression) vector comprising (I); a host cell genetically engineered to comprise (II); a sequence of SRQ ID NOS: 568-1134 (fully defined), where the polypeptide of 19, polynucleotide hybridizing under stringent conditions with any one of SRQ ID NOS: 1-567, a composition comprising the polypeptide of (3); a method of polynucleotide of (3); a method of producing the polypeptide of (3); a method of producing the polypeptide of (3); and a collection of polynucleotides, where the collection comprising any of the sequences of SRQ ID NOS: 1-567. (I) is a polynucleotide comprising any of the sequences of SRQ ID NOS: 1-567 encoding a polypeptide with biological activity, which comprises any of the amino acid sequence of SRQ ID NOS: 1-567 encoding a polypeptide with biological activity, which comprises any of the amino acid sequence of SRQ ID NOS: 1-567 encoding a polypeptide of SRQ

Sequence 708 AA;

```
The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PGR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal cativity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food of sites expressing (II). (I) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention. Note: The sequence data for this electronic format directly from WIPO at the printed specification, but was obtained in electronic format directly from WIPO at

Sequence 17. Application US/0968930

Patent NO. 6825024

GENERAL INFORMATION:
APPLICANT: SEIKI, Motcharu
APPLICANT: SHINGAWA, Akira
TITLE OF INVENTION: NOVEL METALLOPROTEINASE AND ENCODING DNA THEREFOR
FILE REFERENCE: 55-290P
CURRENT APPLICATION NUMBER: US/09/689,730
CURRENT APPLICATION NUMBER: US/08/448,489
PRIOR APPLICATION NUMBER: US/08/448,489
PRIOR FILING DATE: 1995-06-07
NUMBER OF SEQ ID NOS: 19
SOFTWARE: PatentIn Ver. 2.0
SEQ ID NO 17
LENGTH: 631
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AL INFORMATION:
APPLICANT: WILL, HOTSE
TITLE OF INVENTION: DNA SEQUENCES FOR MATRIX
METALLOPROTEASES, THEIR PRODUCTION AND USE
Sequence 18, Application US/08704711A
Patent No. 6114159
GENERAL INFORMATION:
APPLICANT: WILL, HOTST
TITLE OF INVENTION: DNA SEQUENCES FOR MATRIX
TITLE OF INVENTION: DNA SEQUENCES, THEIR PRODUCTION AND USE
NUMBER OF SEQUENCES: 22
CORRESPONDENCE ADDRESS:
ADDRESSEE: Foley & Lardner
